Table of Contents.

Introduction & Background

Why might
someone need
this ML model?
(The backstory)
Vocabulary

Data Collection & Cleaning

The origins of
our dataset and
our process for
preparing it.

EDA & Visualization

Interesting
snippets and
statistics about
our dataset.

Modeling Process

The different
models we
evaluated (& how
they differed).

Conclusion & Next Steps

Results,
explanations,
steps forward,
and the epilogue
to our story.

BONUS: Audience
interaction!

Can a painting's art style be predicted by using the image in a CNN model?

Photo by [Allef Vinicius](#) on [Unsplash](#)

- ▶ Neural networks as a “magic bullet”.
- ▶ So. Many. Art styles.
- ▶ Can be hard to distinguish between, even for art ~~experts~~ aficionados.
- ▶ CNN for predicting art style from image pixel data.

Story Introduction / Problem Statement

- ▶ **Art thieves** who pulled off the heist of the century.
- ▶ Team's resident art expert was KIA.
- ▶ No idea how to fence the stolen art without **knowing the art styles**.
- ▶ Getting a **new art expert** is too risky.
- ▶ **Train a CNN machine learning model** instead!

Neural Net Vocabulary.

- ▶ Convolutional Neural Network (CNN)
- ▶ RGB Pixel Arrays
- ▶ Convolution Filters
- ▶ Kernel Size
- ▶ Batch Normalization
- ▶ Regularization
- ▶ Dropout Layer
- ▶ Dense Layer

Data Dictionary.

Style - artwork style	Link - url for image	V_Sent - sentiment analysis
Artwork - art name	Language - origin language	Hex - color code
Artist	Translated - translated art name	Color - main color of work
Date	Style Num - number for style	

Data Description:

- Data Source : Kaggle
- Data Size : ~120k x 5 columns elements before cleaning
- Data Shape : 89,545 rows x 11 columns after cleaning
-

Style

Style Name Counts

Data Cleaning

- ▶ Drop bad URL's
- ▶ Drop duplicate artwork
 - ▶ Sketches for final work
- ▶ Drop styles with less than 500 pieces
- ▶ Date column
 - ▶ Remove hyphens from date ranges
 - ▶ Keep first date
 - ▶ Change century dates to numeric
 - ▶ VII → 600 (ad)
 - ▶ Drop BC dates

Feature Engineering

- ▶ Translated
- ▶ V_sent
- ▶ Style Number
- ▶ Color
- ▶ Language
- ▶ Hex

EDA!

Scatter of Style by Date

Tableau Dashboard

Preprocessing

Problems in preparing data for modeling

- Converting imgs into arrays
- Filepaths to imgs
- Creating DF of matrices

The solution?

Preprocessing Solution

Tensorflow Keras (*image_dataset_from_directory* function)

- Faster, easier, higher quality
- BatchDataset
- 250x250 pixels
- Categorical Labels

Modeling!

Sometimes, things don't always go to plan

Model Summaries.

baseline: **.0397**

Model	Train Loss	Validation Loss	Train Acc	Validation Acc
CNN with rmsprop	3.2450	3.2479	0.1456	0.1326
CNN with 3 Dense Layers	2.8841	3.079	0.1989	0.1672
CNN with 9x9 Kernel Size and Dropout (.1 - .2)	3.0910	3.0995	0.1628	0.1599
CNN with BatchNormalization and Dropout (.5-.1)	2.6489	3.159	0.2560	0.1797
CNN with 5 Filters, 7x7 Kernel Size, Dropout(.1 - .2), & BatchNormalization	3.0741	3.0341	0.1742	0.1783

Recommendations

- Have some prior knowledge on what you're about to steal, helps a lot
- Don't steal 100,000 artworks at one time, or at least make sure they're all the same style
- Making a machine learning model can takes more time than the cops are giving us
- The model can't direct us much, so lets hope museums have a buy-back program

A collection of various geometric shapes including circles, squares, triangles, and diamonds in orange, blue, yellow, and black, arranged in a decorative pattern on the left side of the slide.

Next Steps.

- ▶ More Time, More Processing Power
- ▶ Combine Classes or Reduce Them
- ▶ Less downsizing, Experiment with more Models

Expressionism or Romanticism?

**Conclusion:
Failed Model but
Successful
Experience**

Streamlit Application!

Welcome to Project Art Thieves!

Input a picture and we will try to predict which style it is from!
